

Well-Pro Dry Pellet Chlorination System

FUNCTIONS:

The well-pro dry pellet chlorinator is installed onto a well and uses the well as the retention system. Dry chlorine pellets are automatically fed down the well at a programmed rate. The chlorine will kill bacteria such as coliform and E.coli. The chlorine will also oxidize iron, manganese and will eliminate hydrogen sulphide gas (rotten egg odor). Water is then fed from the well and into a properly sized multi-media filter. The filter is installed after the existing pressure tank in the house which is designed to remove all of the oxidized iron, oxidized manganese, odor and chlorine residual. The well-pro dry pellet chlorinator can be installed onto either drilled or bored wells providing that the well has the proper retention and meets manufacturer's specifications.

ELIMINATES:

- Iron - Iron Staining - Rotten Egg Odor
- Bad Taste - Algae - Coliform Bacteria
- E-coli Bacteria - Slime - Manganese (Black Slime)

SYSTEM INCLUDES:

- Well-Pro Dry Pellet Chlorinator
- Casing Mount
- Chlorine Test Kit
- 10/54 Fully Automatic Multi-Media Filter
- By-Pass Valve
- 10.5 lbs Well-Pro Chlorine Pellets
